

```
# prompt user to enter a list of names
nameList = [n.strip() for n in input("Enter names separated by commas: ").
↳split(",")]

# check for name in list of names
if name in nameList:
    print(name + " is in the list.")
else:
    print(name + " is not in the list.")
```

Enter a name: Jack
Enter names separated by commas: Jane, Sam, Jack
Jack is in the list.

4 Project #1 Recap

Your task is to develop a video game (can be text based). Some ideas of focus are player profile, inventory system, and combat mechanics. Create a realistic player character with inventory items, each with a description and an associated trait. Enjoy the process!

Incorporate all the concepts following concepts: Multiply python files (includes), files (read and write), JSON, operators, lists, tuples, functions, modules, and classes.

4.0.1 Requirements:

The following can be adjusted for your own game - **Player Type Selection:** Allow players to choose their character type. Set attributes based on the choice (e.g., wizard: magic = 10, knight: magic = 0). - **Inventory Display:** Implement a function to show the player's inventory. - **Item Details:** Write a function to provide detailed information about an inventory item (e.g., Knife: "forged in the depths of Polymar", +5 magic, edged weapon, one-handed). - Bonus: Calculate bonuses when equipping and unequipping items. - **Inventory Management:** Create functions to add and remove items from the inventory. - **Persistence:** Ensure the game can save and reload the player's character using files.

Focus on building the player and inventory system for your text-based adventure game (similar to Zork). The map and gameplay can be developed later.

4.0.2 Game Features:

- **Player Profile:** Include player stats.
- **Inventory System:** Implement a bag to hold items.
- **Items:** Include 10 items, each with a description and trait (e.g., +5 magic).
- **Concepts:** Utilize functions, loops, arrays, classes, and constants. You may also use files and structs if desired.
- **Player Type Selection:** Allow players to choose their character type and set attributes accordingly (e.g., wizard: magic = 10, knight: magic = 0).

- **Inventory Display:** Implement a function to show the player's inventory.
- **Code Quality:** Keep your code clean and consider various player needs, as this project will be handed off to a partner for further development.
